

```
/* =====  
/* Data Types Section  
/* =====
```

/* Data types define the type of values that a variable can hold.

/* Types of Primitive Data types

/* String: Represents a sequence of characters enclosed in single or double quotes.

/* Example:

```
// var myName = 'jatin';  
// console.log(myName);
```

/* Number: Represents numeric values, including integers and floating-point numbers.

/* Example:

```
// var myFavNum = -5;  
// console.log(myFavNum);
```

/* Boolean: Represents a logical entity with two values: true or false.

/* Example:

```
// var isRaining = false;  
// console.log(isRaining);
```

/* undefined: Represents the absence of a value or an uninitialized variable.

/* Example:

```
// var class;  
// console.log(class);
```

/* Null: Represents the absence of a value. It is often used to explicitly indicate that a variable or object has no value.

/* Example:

```
// var output = null;  
// console.log(output);
```

/* Difference Between undefined and Null

/* null: Imagine an Empty Box

/* Explanation: Think of a variable as a box. When we say a box has null inside, it's like having an empty box.

/* Example: You have a toy box, but if it's null, it means there are no toys inside. It's not that the box is broken, it's just empty.

/* undefined: Imagine a Box That Wasn't Opened Yet

/* Explanation: Now, if we talk about undefined, it's like having a box that you haven't opened yet. You know there's something inside, but you don't know what.

/* Example: You have a gift box, and until you open it, you don't know what's inside. Right now, it's undefined.

/* BigInt: Represents integers of arbitrary precision (available since ECMAScript 2020).

/* Example:

```
// const bigNumber = 1234567890123456789012345678901234567890n;
```

```
/* =====  
/* How to identify data type  
/* =====
```

```
// var myname = "jatin";  
// var myFavNum = 12;  
// var myFavNum2 = "12";  
// console.log(typeof myname);  
// console.log(typeof myFavNum);  
// console.log(typeof myFavNum2);  
// Whatever you write in single or double quote it make an string
```

```
// var myFavNum;  
// console.log(typeof myFavNum);  
  
// var myFavNum2 = null;  
// console.log(typeof myFavNum2);  
  
// var isRaining = false;  
// console.log(typeof isRaining);
```
